

# Complete Sink Systems

A complete sink system is a fully integrated solution that combines boiling water, filtration, waste management, and intelligent under-sink design into one engineered installation.

## 1. What Is a Sink System?

Most kitchens treat sink appliances as separate additions installed over time. A sink system approaches the sink as a single functional unit — designed, supplied, and installed as one coordinated solution.

- Boiling water on demand
- Filtered cold drinking water
- Quiet waste disposal
- Optimised under-sink layout
- Correct pressure and safety management
- Professional commissioning and handover

## 2. Core Components of a Sink System

- Boiling Water Tap – Provides instant boiling water without the need for kettles.
- Under-Sink Tank – Stores and regulates heated water safely and efficiently.
- Filtration System – Improves water quality and taste for drinking and cooking.
- Waste Disposal Unit – Breaks down food waste to reduce bin usage and odours.
- Pressure & Safety Controls – Ensures manufacturer compliance and safe operation.
- Cabinet Optimisation – Clean pipe routing and intelligent space use.
